Exercises accompanying the notes from Charles Pinter's 'A Book of Abstract Algebra'

Contents

Operations

Exercise 1. For each rule, is it an operation, if not, why?

1. $a * b = \sqrt{|ab|}$, on the set $\mathbb{Q}$
   No. If $a = b = 1$, then $1 * 1 = \sqrt{2} \notin \mathbb{Q}$

2. $a * b = a \ln b$, on the set $\{x \in \mathbb{R} : x > 0\}\}$.
   No. It is not closed under $*$, e.g $0 < b < 1$, then $a * b = a \ln b < 0$

3. $a * b$ is a root of the equation, $x^2 = a^2 b^2$, on the set $\mathbb{R}$
   No. The operation isn't uniquely defined. $x^2 = a^2 b^2$ has to two roots, namely $+ab$ and $-ab$

4. Subtraction, on the set $\mathbb{Z}$.
   Yes.

5. Subtraction, on the set $\{n \in \mathbb{Z} : n \geq 0\}$.
   No. e.g. $b = a + 1$ then $a * b = -1$ which is not in the set.

6. $a * b = |a - b|$, on the set $\{n \in \mathbb{Z} : n \geq 0\}$
   Yes. (distance metric)

Exercise 2. Indicate whether or not :

   I   it is commutative,

  II   it is associative,

 III $\mathbb{R}$ has an identity element with respect to $*$

 IV   every $x \in \mathbb{R}$ has an inverse with respect to $*$

1. $x * y = x + 2y + 4$

   I Commutativity:

$$y * x = y + 4x + 4 \neq x + 4y + 4 \quad \forall x, y \in \mathbb{R} \tag{1}$$

   Not commutative

II Associativity:

$$x * (y * z) = x * (y + 2z + 4) = x + 2(y + 2z + 4) + 4$$
$$(x * y) * z = (x + 2y + 4) * z = x + 2y + 4 + 2z + 4$$
$$x * (y * z) \neq (x * y) * z \tag{2}$$

Not associative

III Existence of identity:

$$x * e = x + 2e + 4 = x$$
$$2e = 4 \implies e = -2 \tag{3}$$

Check

$$x * 2 = x + -2 * 2 + 4 = x$$
$$2 * x = -2 + 2x + 4 = 2 * (x + 1) \tag{4}$$

No identity element, and thus no inverses.

2. $x * y = x + 2y - xy$

I Commutativity:

$$y * x = y + 2x - yx \neq x + 2y - xy \quad \forall x, y \in \mathbb{R} \tag{5}$$

II Associativity:

$$x * (y * z) = x * (y + 2z - yz) = x + 2(y + 2z - yz) - x(y + 2z - yz)$$
$$= x + 2y + 4z - 2yz - xy - 2xz + xyz$$
$$(x * y) * z = (x + 2y - yx) * z = x + 2y - yx + 2z - (x + 2y - yx)z$$
$$= x + 2y - yx + 2z - xz - 2yz + yxz$$
$$x * (y * z) \neq (x * y) * z \tag{6}$$

III Existence of identity:

$$x * e = x + 2e - xe = x$$
$$2e - xe = e(2 - x) = 0 \implies e = 0 \tag{7}$$

Check

$$x * 0 = x + 0 - 0 = x$$
$$0 * x = 0 + 2x - 0 = 2x \tag{8}$$

No identity element, thus no inverses.

3. $x * y = |x + y|$

I Commutativity:

$$y * x = |y + x| = |x + y| = x * y \tag{9}$$

II Associativity:

$$x * (y * z) = x * |y + z| = |x + |y + z||$$
$$(x * y) * z = |x + y| * z = ||x + y| + z| \tag{10}$$

$x * (y * z) \neq (x * y) * z$, to see this set $x = 1, y = -2, z = 0$

$$|1 + |-2|| \neq ||1 - 2||$$

III Existence of identity:

$$x * e = |x + e| = x \implies e = 0 \tag{11}$$

Check

$$x * 0 = |x + 0| = x$$
$$0 * x = |0 + x| = x \tag{12}$$

IV Existence of inverses:

$$x * x' = |x + x'| = 0 \implies x' = -x \tag{13}$$

Check

$$x * (-x) = |x + (-x)| = 0$$
$$(-x) * x = |(-x) + x| = 0 \tag{14}$$

4. $x * y = |x - y|$

I Commutativity:

$$y * x = |y - x| = |-(x - y)| = |x - y| \tag{15}$$

II Associativity:

$$x * (y * z) = x * |y - z| = |x - |y - z||$$
$$(x * y) * z = |x - y| * z = ||x - y| - z| \tag{16}$$

$x * (y * z) \neq (x * y) * z$, to see this set $x = 1, y = -2, z = 0$

III Existence of identity:

$$x * e = |x - e| = x \implies e = 0 \tag{17}$$

Check

$$x * e = |x - 0| = x$$
$$e * x = |0 - x| = x \tag{18}$$

IV Existence of inverses:

$$x * x' = \left| x - x' \right| = 0 \implies x' = x \tag{19}$$

Check

$$x * x' = \left| x - x' \right| = \left| x - x \right| = 0$$
$$x' * x = \left| x' - x \right| = \left| x - x \right| = 0 \tag{20}$$

5. $x * y = xy + 1$

   i Commutativity:

$$y * x = yx + 1 = xy + 1 = x * y \tag{21}$$

  ii Associativity:

$$x * (y * z) = x * (yz + 1) = x(yz + 1) + 1 = xyz + x + 1$$
$$(x * y) * z = (xy + 1) * z = (xy + 1)z + 1 = xyz + z + 1 \tag{22}$$

$$(x * y) * z \neq x * (y * z)$$

 iii Existence of identity:

$$x * e = xe + 1 = x$$
$$xe = x - 1$$
$$e = \frac{x - 1}{x} \tag{23}$$

Check

$$x * e = x\frac{x - 1}{x} + 1 = x - 1 + 1 = x$$
$$e * x = \frac{x - 1}{x}x + 1 = x - 1 + 1 = x \tag{24}$$

6. $x * y = \max\{x, y\}$

   I Commutativity:

$$y * x = \max\{y, x\} = x * y \tag{25}$$

  II Associativity:

$$x * (y * z) = x * \max\{y, z\} = \max\{x, \max\{y, z\}\}$$
$$(x * y) * z = \max\{x, y\} * z = \max\{\max\{x, y\}, z\} \tag{26}$$

 III Existence of identity:

$$x * e = \max\{x, e\} = x \implies e \leq x \tag{27}$$

 IV Existence of inverses:

$$x * x' = \max\{x, x'\} = e \leq x \tag{28}$$
